

Status of ntuples with “true” Branson weights

Yujun Wu

Why to re-produce all $2e33$ ntuples?

- Both signal and hlt samples have been done using ntuple maker: Version 2.05
- Version 2.06 has more pileup info, important for Branson-weighting.
- This data set will be important for the March TDR.

Where are we now?

- Production on hlt samples has been started since Dec 20, 2002;
- About **850,000** events have been processed-----total **1,130,000** events;
- Hope to finish by this weekend;
- Then start to process the signal events -----no new variables there with the new version of ntuple maker.

Other issues

- Transfer the data to CERN:
Disk space and access is always an issue at CERN. Can't do the transfer right now.
- Whether to process the BigMB123 data
- Jet and Met User Federation will still be at Fermilab (Spring 2002).
